These are the STL files for printing the Cabled Knee Hinge out of Stainless Steel or Titanium. I've adjusted the files for 3D Printing via SLS process which included lighter tolerances than 3D Printing. It depends on the batch & sintering laser & material. This *should* be good for Steel & Titanium, but it varies based on manufacturer and process. I've run this through [PCBWay](#) and I've loosened some of my tighter parts from the first try which were too tight.

DO print these on your 3D Printer **FIRST**. That's a cheap and easy way to ensure that this is what you're looking for prior to ordering with these files. The same hardware used in the base [Knee Exo Hinge](#) will interface with this design.

These designs are proprietary to Crash Makerspace™ and is for your, the Patron's, sole usage and not for resale, distribution, or modification, including derivative versions of this file set. The channels serve as video Proof of Original Copyright for these files. These are for educational & research purposes only. Do not use in dangerous activities like wearing these on your body up to the professional environments in compliance with applicable laws.
